                                                                                                                                                                                                   The invention relates to antisense compounds, compositions and methods for modulating the expression of PTEN (also known as MMAC1 and TEP1). Th compound is useful for inhibiting the expression of PTEN in cells or tissues to treat diseases associated with their expression, e.g. metabolic diseases or conditions, type 2 diabetes or hyperproliferative conditions. In addition, the compound is used for diagnostics, prophylaxis, or as research reagents or kits. The invention is useful in gene therapy. The present sequence is human PTEN DNA specific double stranded antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (MONI/) MONIA B I

                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel predictor set comprising a plurality of polynucleotides and/or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine kinase pathway. The molecules of the invention demonstrate cytostatic, antiangiogenic, vasotropic and vulnerary activities and may be useful in the field of pharmacogenomics, in particular for determining drug sensitivity and in treating breast cancer, hypervascular diseases, angiogenesis and scars in wound healing. The current sequence is that of a human protein tyrosine kinase biomarker-related RT-PCR primer of the

The sequences given in AAQ44791-92 are primers which may be used in the camplification of noggin DNA fragments from murine noggin. The amplified CDNA of 260 nucleotides corresponds to nucleotides 2-262 of murine noggin. CC The amplified sequence was used as a probe in the isolation of human CC noggin DNA. The noggin DNA sequence encodes a 26 kD secreted protein CC which has a hydrophobic amino terminal sequence. The carboxy terminal CC sequence of noggin bnows homology to a kunitz-type protease inhibitor. CC indicating that it may exhibit activities of a protease inhibitor. Noggin is a regulator of cartilage production and a growth factor for tissue CC matrix and epidermis. Noggin is useful for regulating cartilage and bone growth, optionally in conjunction with other growth factors which may be conjunction with other growth factors which may be conjunction of its receptor, which may itself be used as a diagnostic probe conjunction of its receptor, which may itself be used as a diagnostic probe conjunction with nother growth factors of fibroblast conjunction to the activin. Noggin may be used for enhancing the survival or inducing the growth of nerve and muscle cells. It may therefore be useful in the therapy of congenital conditions or conjunction's chorea and or peripheral neuropathy. (Updated on 25-MAR-2003 to correct PN field.)                                                                                                                                                                The sequences given in AAI72937-38 are probes which were designed based CC on conserved peptide regions derived mouse Noggin polypeptide. These CC probes were used in the isolation of human noggin cDNA. Noggin is a CC neurotrophic growth factor which induces dorsal development in CC modifies the actions of fibroblast growth factor (FGF). It is a 26 kD CC protein with a hydrophobic amino terminal. Noggin is secreted, apparently CC as a dimeric glycoprotein. The carboxy terminal region of Noggin shows CC homology to a Kunitz-type protease inhibitor. Noggin polypeptide may be grepared by culturing cells transformed with a vector that contains a CC control sequence operatively linked to a nucleic acid molecule which CC comprises the coding region for human noggin or a sequence encoding the CC same amino acid sequence. Human Noggin, also its fusion proteins and CC diagnosis, for detection and purification of Ab, to induce growth of CC control sequence cells in mammals, and to regulate bone or muscle growth, CC e.g. in wound-healing compositions and for treating neurodegeneration CC (Alzheimer's, Parkinson's or Huntington's diseases, amyotrophic lateral CC sclerosis and peripheral neuropathy), traumantic nerve injury, diabetes, CC kidney dysfunction, the toxic effects of chemotherapeutic agents being CC congenital malformations such as anencephaly, as an additive to culture media used for growing nerve cells and to isolate cognate receptors, cc potentially useful for diagnosis of some cancers. Ab's are used for in vitro or in vivo therapy or diagnosis and for purification of Noggin
                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Noggin protein capable of inducing dorsal growth, and sequences encoding it - useful for treating neurodegenerative disorders and neural damage, e.g. due to trauma or after chemotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alzheimer's disease; Parkinson's disease; Huntington's disease; probe; amyotrophic lateral sclerosis; peripheral neuropathy; culture media; traumatic nerve injury; diabetes; kidney dysfunction; anencephaly; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Valenzuela DM,

Human prostacyclin synthase and DNA encoding it - useful investigation and treatment of diseases characterised by prostaglandin I2 production. Disclosure; Page 34; 71pp; Japanese reduced

DNA primers (AAT05317-20; AAT05322; AAT05326-27) are used to screen human genomic lung cell line W138 and human arterial endothelial cell cDNA libraries for the isolation of a prostacyclin-synthase (PGIS) coding sequence (see AAT05316). Two oligomucleotide probes (AAT05321, AAT05323) were used in the construction of plasmid pHPGIS1, encoding the complete PGIS sequence. This plasmid was used to transfect human 293 cells for PGIS peptide expression. DNA encoding human PGIS, vectors containing it, and PGIS itself, may be administered to patients to increase prostaglandin I2 (PGI2) production to treat diseases characterized by reduced PGI2 levels or by an imbalance between PGI2 and thromboxane A2 levels, such as circulatory diseases (thrombosis, angina pectoria, arteriosclerosis, myocardial infarction). The DNA and protein are also useful in disease diagnosis screen human

Sequence 18 BP; 2 A; 7 C; 3 G; 6 T; 0 U; 0 Other;

adipocytes containing an immortalising fragment of a viral oncogene. The
immortalised adipocytes are used to identify substances able to regulate
lipolysis and/or thermogenesis (potential therapeutic agents for treating
diabetes and obesity). The cell lines have the advantage that they can be
maintained in long term culture (contrast primary cultures of adipocytes)
without loss of characteristic markers or ability to differentiate. The
immortalised pre-adipocytes differentiate into mature adipocytes when
placed in a medium containing insulin and dexamethasone. The primers
ANT43098-19 are used to amplify marker genes to verify differentiation of
the pre-adipocytes into mature adipocytes. Primers ANT43106-7 were used
to amplify a 236 bp region of the gene encoding beta-actin
                                                                                                                                                                                                                                                       misc_binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immortalised pre-adipocytes contg viral oncogene fragment - identifying cpds that regulate lipolysis and thermogenesis, agents and models for studying adipocyte processes.

                                                                                                                                                                                                                                                                                                                                                                                                                                  á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents RNA coupled to a photosensitive CC texaphyrin molecule, which was used in a new method for photocleavage of CC DNA. Targeted intracellular light-induced cleavage of a selected DNA CC comprises introducing into a cell a photosensitive texaphyrin (PT) CC coupled to an oligonucleotide which is complementary to the selected DNA CC and exposing the cell to light to cleave the DNA. Modulating the activity of a selected DNA comprises contacting the DNA with a PT coupled to an CC clight to cleave the DNA. These methods can be used e.g. in cleavage of CC light to cleave the DNA. These methods can be used e.g. in cleavage of CC DNA in footprinting analysis, DNA sequencing, chromosome analyses, gene cisolation, recombinant DNA manipulations, mapping of large genomes and CC chromosomes and for site-directed mutagenesis. They can also be used in CC canti-viral therapy and for the treatment of cancers, inflammatory CC responses that are caused by over expression of certain proteins, CC infectious diseases and genetically-based disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identification; genetic target; gene modulation; human; probe; antisense oligonucleotide; phosphorothioate; PCR primer; nucleotide sequence-based technology; antisense drug discovery;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (II)-2R gamma encoded RNA. AAV9389 to AAV94574 represent specifically claimed ribozymes, and AAV94575 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy
                                                                                                                                                                                                                                                                                                                                                           13-APR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   888888888888888888888888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC A method has been developed of defining a set of compounds that modulate CC the expression of a target nucleic acid (tNA) sequence via binding of the CC compounds with the tNA sequence. The method comprises generating a CC library of virtual compounds in silico according to defined criteria, and CC evaluating in silico the binding of the virtual compounds with the tNA CC according to defined criteria. Also described are: (1) a method of CC defining a set of oligonucleotides (ONS) that modulate the expression of CC a tNA sequence via binding of the ONS with the tNA sequence comprising CC generating a library of virtual compounds in silico according to defined CC criteria, and evaluating in silico the binding of the virtual ONS with the tNA sequence via binding CC of compounds that modulate the expression of a tNA sequence via binding CC of compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, CC chemical or bioactive properties. Information gathered from assays of CC compounds is used to identify nucleotide sequence-based technologies, e.g. CC antisense drug discovery and target validation. AAZ40852 to AAZ41220, and CC AAY52701 to AAY52706, represent sequences used in the exemplification of the creamy invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

A method has been developed of defining

മ

set of

compounds

that

modulate

Example 16; properties,

Identifying compounds which modulate expression of nucleic acids, used to provide compounds having defined physical, chemical or bioactive

e.g. antisense activity. Page 95; 264pp; English

WPI; 1999-620446/53.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC the expression of a target nucleic acid (tNA) sequence via binding of the CC compounds with the tNA sequence. The method comprises generating a CC library of virtual compounds in silico according to defined criteria, and CC evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of CC defining a set of oligonucleotides (ONs) that modulate the expression of CC at NA sequence via binding of the ONs with the tNA sequence comprising CC generating a library of virtual compounds in silico according to defined CC criteria, and evaluating in silico the binding of the virtual ONs with the tNA according to defined criteria, and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding compounds with the tNA. The methods can be used for the generation CC and identification of synthetic compounds having defined physical, CC chemical or bioactive properties. Information gathered from assays of Such compounds is used to identify nucleotide sequence-based technologies, e.g. CC antisense drug discovery and target validation. AAZ40852 to AAZ41220, and CC AAX52701 to AAX52706, represent sequences used in the exemplification of the compolitication of compounds and target validation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5' (alpha)n-beta -N3'; or (X)m5' (gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptides having at least two new nucleotides - \operatorname{PCR}.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         18-JUL-1997;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    18-JUL-1997;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     09-FEB-1999.

                                                                                                                                                  The invention provides antisense compounds of 8-30 nucleotides that inhibit the expression of human Akt-1. The antisense compounds may be used for diagnostics, therapeutics (for modulating the expression of Akt-1), prophylaxis (e.g. to prevent or delay infection, inflammation, or tumor formation), as research reagents (e.g. to distinguish between members of a biological pathway) and in kits. Sequences AAZ22197-236 represent phosphorothioate oligonucleotides used for antisense inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 18 BP; 2 A;
                                                                                                           Sequence 18 BP;

                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                             CC fructose:glucose ratio in mature tomatoes. Also described are: (1)
CC breeding tomato plants that produce tomatoes having superior taste
CC characteristics. At least one Lycopersicon esculentum plant is crossed
CC with a Lycopersicon spp. to produce hybrid (P1) seeds, which grow into P1
CC plants that produce seeds. These seeds produce plants, which produce ripe
CC fruit, in which the fructose:glucose content is determined using the
CC marker gene; and (2) tomato plants produced by the method, and their
CC fruit and seeds. The marker is useful for finding (and cloning) genes
CC that produce tomatoes having superior taste characteristics. The marker
CC gene is also useful in a method of breeding tomato plants for selecting
CC plants producing fruit having desired characteristics, including a higher
CC fructose:glucose ratio than that of standard L. esculetum. The molecular
CC marker enables the selection of tomato plants at the young seedling
CC stage, and eliminates undesirable environmental effects on the plant
CC phenotype, which can limit the effectiveness of selection for a phenotype
CC characteristic. The present sequence represents a primer used in
CC producing an amplification product for use as the marker
                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New molecular marker for a gene determining fructose:glucose ratio in mature tomatoes - useful for finding this gene and producing tomato seeds, plants and/or fruit with an increased fructose to glucose ratio.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC fructose:glucose ratio in mature tomatoes. Also described are: (1)
CC breeding tomato plants that produce tomatoes having superior taste
CC characteristics. At least one lycopersicon esculentum plant is crossed
CC with a Lycopersicon spp. to produce hybrid (F1) seeds, which grow into F1
CC plants that produce seeds. These seeds produce plants, which produce ripe
CC fruit, in which the fructose:glucose content is determined using the
CC marker gene; and (2) tomato plants produced by the method, and their
CC fruit and seeds. The marker is useful for finding (and cloning) genes
CC that produce tomatoes having superior taste characteristics. The marker
CC gene is also useful in a method of breeding tomato plants for selecting
CC plants producing fruit having desired characteristics, including a higher
CC fructose:glucose ratio than that of standard L. esculetum. The molecular
CC stage, and eliminates undesirable environmental effects on the plant
CC stage, and eliminates undesirable environmental effects on the plant
CC characteristic. The present sequence represents a primer used in
CC producing an amplification product for use as the marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Local Similarity

AA269579 to AA277440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC invention, which contain a polymorphic base at position 24 of their controlled sequences. AAZ69579 to AAZ7440 represent amplification controlled sequences. The biallelic markers of the invention controlled average for the biallelic markers of the invention controlled sequence, and in complex association studies and haplotyping studies controlled action of the targets for the genetic basis for disease states. CC compositions and methods of the invention can also be useful for the compositions and diagnostic methods, as well as the characterisation of the cargets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the controlled controlled soft acting on a disease as well as other treatment. CC N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and correct invention.

                                                                                                                                                                                                                                        The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Altshuler

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing, medicine and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR pr

                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a substantially purified or isolated nucleic CC acid (1) from ryegrass or fescue species including a simple sequence CC repeat (SSR), having 2 or more tandemly repeated nucleotide core elements CC 2-6 nucleotides in length. Also included are a nucleic acid primer CC suitable for amplifying an SSR, identifying (M1) an SSR by preparing a CC library of ryegrass or fescue genomic DNA enriched for SSRs and CC identifying clones in the library containing SSRs, a library of ryegrass or cereal breeding by identifying an SSR that is closely CC or fescue genomic DNA enriched for SSRs prepared by the M1, selecting for CC a gene in grass or cereal breeding by identifying an SSR that is closely CC associated with the gene such that the SSR and the gene are CC preferentially co-inherited, and selecting for the SSR in the breeding, a CC method for DNA profiling grass or cereal species varieties by assessing CC variation between SSR varieties and testing the purity of grass or cereal seed batches by assessing variation within seed batch of an SSR. The SSRs CC may be used in the selection of genes in grass or cereal breeding, for the selection of genes in grass or cereal breeding, for the selection of genes in grass or cereal breeding, for the selection of genes in grass or cereal breeding, for the selection of genes in grass or cereal breeding, for the selection of genes in grass or cereal breeding.
                                                                                                                                                                                                                                                                                                                                                 Query Match

The oligonucleotides may be used with an opioid analgesic. They are also useful for minimizing glutamate neurotoxicity and/or excitotoxicity associated with stroke, ischemia, CNS trauma, neurodegenerative disorders, gastrointestinal disorders or to inhibit tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         from the sequence of metabotropic glutamate receptor type 1 (mGluR1) gene. The antisense oligonucleotide binds to a portion of mRNA expressed from the gene or its splice variant. The binding of the oligonucleotide to the mRNA is effective in decreasing the translation of the mRNA in a host cell expressing the gene. The oligonucleotides are useful for
                                                                                                                                                                                                                                                                                                                                         Antisense; metabotropic glutamate receptor type 1; mGluR1; pain; inflammation; arthritis; opioid analgesic; glutamate; neurotoxicity; tumour; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             19-APR-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides to metabotropic glutamate receptor type 1 gene, which specifically hybridize to mRNA expressed from the gene useful for treating disorders related to elevated glutamate level such as pain.

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        from the gene or its splice variant. The binding of the oligonucleotide to the mRNA is effective in decreasing the translation of the mRNA in a host cell expressing the gene. The oligonucleotides are useful for treating chronic pain caused by injury or inflammation of a nerve caused by arthritis. The oligonucleotides may be used with an opioid analgesic. They are also useful for minimizing glucamate neurotoxicity and/or excitoxxicity associated with stroke, ischemia, CNS trauma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense oligonucleotides to metabotropic glutamate receptor type 1 gene, which specifically hybridize to mRNA expressed from the gene useful for treating disorders related to elevated glutamate level such as pain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     JP2001321190-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; chromosome PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11-APR-2002

```

The present invention relates the DNA are the proteins contain at least one PVD (I the proteins contain attended with impaint to treat diseases associated with impaint transduction, particularly inflammation

DNA and their encoded proteins, PYD (pyrin) domain. These can be impaired intracellular signal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      용
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ភភភភភភ
cc and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic cc acid, where the oligonucleotide binds in a parallel and antiparallel cc orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The cligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA cc for diagnostic and therapeutic purposes. The oligonucleotides can be cc selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for creplication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotides can be chosen to target a unique sequence of the can be consent to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The coligonucleotides can be used in cancer treatment by way of triple-helix
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches 16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               suppression of specific oncogenes including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention
                                         The invention relates to a novel oligonucleotide primer comprises in the following order, from 5' to 3': a phage-encoded RNA polymerase recognition sequence; a spacer sequence comprising a sequence of 12-21 nucleotides; and a target complementary sequence that can bind a segment a target nucleic acid. The oligonucleotide primer is useful in amplifying a target nucleic acid. The primer is also useful for copying intermediate duplexes and target nucleic acids. This polymucleotide represents an example of a spacer sequence between an RNA polymerase
                                                                                                                                                                                                           New oligonucleotide primer having phage-encoded RNA polymerase recognition sequences, spacer sequences and target complementary sequences, useful in nucleic acid amplification procedures or for target nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18 BP; 0 A;
                                                                                                                                                                                                                                                                                                                                                                                                                      07-JUN-2002; 2002WO-US018229

                                                                                                                                                                                                                                                                                                                                                         This invention relates to novel methods of parallel gene cloning and analysis. Specifically, it provides a systematic and oriented codon based method for the identification of both known and unknown sequences, as well as the relevant genetic algorithms for this sequence identification and library construction. The methods of the invention work to identify genetic signatures such as the start and stop codons, and restriction enzyme sites. This oligonucleotide sequence is the upstream PCR primer 17, an 18mer oligo used for PCR screening to identify corresponding cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New kit for parallel gene cloning and analysis or for identifying genetic signatures within a sample comprises a panel having a plurality of oligonucleotides or peptides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to novel methods of parallel gene cloning and analysis. Specifically, it provides a systematic and oriented codon base method for the identification of both known and unknown sequences, as well as the relevant genetic algorithms for this sequence identification and library construction. The methods of the invention work to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               genetic signatures such as the start and stop codons, and restriction enzyme sites. This oligonucleotide sequence is the upstream PCR primes an 18mer oligo used for PCR screening to identify corresponding cDNA
                                                                                                                                                                                                                                                                                                                                                      respiratory distress syndrome; allergic rhinitis; emphysema; chronic obstructive reference.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human CD23-derived oligonucleotide SEQ ID 13511.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            29-JUL-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequences of known peptide epitopes, a method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 60; 129pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, and the invention has antiallergic, antiinflammatory, antiasthmatic, and composition comprises oligonate. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, allergies and/or burdences that the production are associated with a disease or condition such as pulmonary vasoconstriction are associated composition, allergies, asthma, impeded respiration, respiratory of inflammation, allergies, asthma, impeded respiration, respiratory constructive pulmonary disease, pulmonary constructive pulmonary disease, pulmonary constructive pulmonary disease, pulmonary constructive pulmonary disease, pulmonary construction, and content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system of the oligonucleotides into products that free adenosine into the system of constructive pulmonary that the breakdown of the oligonary breakdown of the pulmonary that the breakdown of constructive pulmonary that the breakdown of the pulmonary that t

Toligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a Vbeta gene.

Disclosure; SEQ ID NO 716; 164pp; English

The invention relates to a kit for diagnosing and treating T-cell cassociated diseases which comprises a panel of nucleic acid primers of specifically priming and allowing amplification of each Vbeta gene, the taxto or cDNA. The kit is useful for diagnosing organ transplant crejection and diagnosing and treating T-cell associated diseases, because of including autoimmune diseases, degenerative nervous system diseases, commune diseases, infectious diseases, and noplastic diseases, hypersensitivity diseases, infectious diseases, arrophic gastritis. Degenerative nervous system diseases include multiple collections and Alaheimer's diseases include addison's disease, arrophic gastritis. Degenerative nervous system diseases include Type collections and Alaheimer's disease. Hypersensitivity diseases include Type collections that lead to allergies, Type II hypersensitivities such as those gresent in the collections are such as those caused by viruses such as HIV, fungal infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by hypobacterium. Neoplastic diseases include lymphoproliferative diseases include lymphoproliferative diseases. such as leukaemias, lymphomas and cancers such as cancer of The present sequence represents a Vbeta gene repeat

New NOVX polypeptides and nucleic acid molecules useful for preventing (treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics. or P

Disclosure; SEQ ID NO 1371; 1880pp; English.

The invention relates to a novel isolated polypeptide (NOVX). A CC polypeptide of the invention has cytostatic, immunomodulator, neuroprotective, nootropic, anorectic, antidiabetic, antidiabetic, and as a control of the structure of another control of the control of the structure of a comparishing control of the structure of a composition of the solypeptides are encoded by NOVX polymentacture of a composition of the solypeptide is useful in the manufacture of a control of the solypeptide and antibody are useful in diagnosing. The polypeptide and antibody are useful in diagnosing, control of treating or preventing NOVX-associated disorders, e.g. cancer, cachexia, control of the present sequence control of the control of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-cend of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a coligonucleotide. The method is useful for preventing or treating a crespiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory on lung disease. The respiratory or lung disease is consen from airway inflammation, allergy(ies), asthma, impeded consen from airway inflammation, allergy(ies), asthma, impeded consention, cystic fibrosis (CP), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region cowith 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDB4 A, PDE4 B, PDE4 C or PDE4 D. The invention color relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the color color more nucleic acid target(s) or expressed product(s), for the coligonuclectides are useful for reducing or inhibiting expression of a come or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, cc crayctase b, PDE4 B, PDE4 B, PDE4 C, or PDE4 D. The oligonuclectides are useful for preventing or treating a respiratory or lung disease in cryptase b, PDE4 B, PDE4 C, or PDE4 D. The oligonuclectides are cusful for preventing or treating a respiratory or lung disease to cand/or increased levels of, adenosine and/or levels of adenosine A creceptor(s), and/or asthma and/or lung allergies associated with Cc inflammation or an inflammatory disease. The respiratory or lung disease in chosen from airway inflammation, allergy, asthma, impeded respiration, complete consistivities are syndrome, pulmonary conceptor of the pronchoconstriction. This sequence represents an oligonucleotide of the conceptor of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; mengeded respiration; cystic fi chronic obstructive pulmonary disease; COPD; allergic rhinit acute respiratory distress syndrome; pulmonary hypertension;

CC golymicleotide from which a polypeptide is producible to confer a guality than that conferred by a parent polymicleotide that encodes the CC guality than that conferred by a parent polymicleotide that encodes the CC same polypeptide. The method comprises: (a) selecting a first codon of CC the synonymous codon is selected on the basis that it exhibits a CC different phenotypic preference than the first codon in a comparison of CC different phenotypic preference than the first codon in a comparison of CC different phenotypic preference than the first codon in a comparison of CC determining the phenotypic preference of a first codon in a comparison of CC determining the phenotypic preference of a first codon in an organism CC of interest or its parts; (2) a synthetic polymicleotide construct that the synonymous codon to construct the method above; (3) an organism or interest or part containing a synthetic construct that CC comprises a regulatory polymicleotide constructed from CC synthetic polymicleotide constructed from CC encodes a reporter protein, which produces, or is predicted to produce a CC encodes a reporter protein, which produces, or is predicted to produce a CC encodes the polypeptide; (6) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or part containing a synthetic polymicleotide that CC encodes the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part CC and that results from the expression of a parent polymicleotide that CC encodes the polypeptide; (6) a method of reducing the quality of a selected phenotype that is displayed by an organism of interest or part CC and that results from the expression of a parent polymicleotide that CC encodes the polypeptide; The method is useful for constructing a synthetic polymicleotide that conferred by a polymicleotide is producible to conference a selected phenotype to an organism of interest or part in a selected phenotype to an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 1415
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 1; SEQ ID NO 67; 86pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                                             different phenotypic preference than the first codon in a comparison of phenotypic preferences in test organisms or parts, where the test organism are selected from organisms of the same species as the organism of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polynucleotide constructed from the method above; (3) an organism or interest or part containing a synthetic polynucleotide constructed from the method above; (4) an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polymulectide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polymuclectide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polymuclectide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a
      organism or interest or part containing a synthetic construct that comprises a regulatory polynucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter polynucleotide that encodes a reporter protein, which produces, or is predicted to produce a selected phenotype or a phenotype of the same class as the selected phenotype in the organism or part; (5) a method of modulating the quality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      phenotype displayed by an organism a synthetic leader sequence, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a fire

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC of a selected phenotype that is displayed by an organism of interest or CC part and that results from the expression of a parent polynucleotide that CC encodes the polypeptide; (6) a method of enhancing the quality of a CC selected phenotype that is displayed by an organism of interest or part CC encodes the polypeptide; and (7) a method of reducing the quality of a CC selected phenotype that is displayed by an organism of interest or part CC encodes the polypeptide; and (7) a method of reducing the quality of a CC and that results from the expression of a parent polynucleotide that CC encodes the polypeptide. The method is useful for constructing a CC synthetic polynucleotide from which a polypeptide to spread by an organism of interest or part in a different CC quality than that conferred by a parent polynucleotide that encodes the golypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes constructed leader sequence, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
```

The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of phenotypic preferences in test organisms or parts, where the test organism are selected from organisms of the same species as the organism

Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide

Example 1, SEQ ID NO 31; 86pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC the method above; (3) an organism or interest or part containing a synthetic polynucleotide constructed from the method above; (4) an CC synthetic polynucleotide constructed from the method above; (4) an CC compaises a regulatory polynucleotide operably linked to a trandem repeat CC comprises a regulatory polynucleotide operably linked to a trandem repeat CC encodes a reporter protein, which produces, or is predicted to produce a CC selected phenotype or a phenotype of the same class as the selected CC phenotype in the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or CC part and that results from the expression of a parent polynucleotide that CC encodes the polypeptide; (6) a method of enhancing the quality of a celected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that CC encodes the polypeptide; and (7) a method of reducing the quality of a celected phenotype that is displayed by an organism of interest or part CC and that results from the expression of a parent polynucleotide that CC encodes the polypeptide. The method is useful for constructing a CC synthetic polynucleotide from which a polypeptide is producible to confer cC and that conferred by a parent polynucleotide that encodes the polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism of interest or part in a different cC invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC different phenotypic preference than the first codon in a comparison of corganism are selected from organisms or parts, where the test corganism are selected from organisms of the same species as the organism co finterest and organisms that are related to the organisms of interest; cand (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for construct the synthetic polynucleotide, also described: (1) an exthod for constructed from the method above; (3) an organism or interest or part containing a synthetic polynucleotide constructed from the method above; (4) an corganism or interest or part containing a synthetic construct that comparises a regulatory polynucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter polynucleotide that comparises a regulatory polynucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter polynucleotide that constructed phenotype in the organism or part; (5) an ethod of modulating the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that concodes the polypeptide; (6) a method of enhancing the quality of a clected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that concodes the polypeptide; and (7) a method of reducing the quality of a clected phenotype to an organism of a parent polynucleotide that concodes the polypeptide. The method is useful for constructing a selected phenotype to an organism of interest or part in a different concodes the polypeptide. It is useful for modulating the quality of a selected phenotype to an organism of interest or part in a different concodes the polypeptide. It is useful for modulating the quality of a selected of phenotype to an organism or part. The present sequence encodes convention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

```
The present invention relates to a method for identifying a subject at CC risk of breast cancer. The method comprising detecting the presence or CC absence of one or more polymorphic variations associated with breast CC cancer in a nucleic acid sample from a subject. The nucleic acid sample (comprises the DLG1 region (AD079402), XIAA0783 region (AD079403), DPF3 CC region (AD079404) or CENPC1 region (AD079405). The gene DLG1 (discs; CC large homolog 1 (Drosophila)) is also known as synapse-associated protein (CC 97, hdlg or SAP97. DLG1 has been mapped to chromosomal position 329. The gene KIAA0783 is also known as PHF14 and PHD finger protein 14. KIAA0783 cC has been mapped to chromosomal position 7p21.3. The KIAA0783 protein is a novel gene with unknown function, however, being a zinc finger protein, CC it likely to be a transcription factor. The gene DPF3 (D4, zinc and CC double PHD fingers, family 3) is also known as CERD4, cer-d4, FLJ14079 CC and 2810403803Rik. DPF3 is a Rho family guanine-nucleotide exchange (factor. DPF3 has been mapped to chromosomal position 14q24.3-q31.1. The CENPC1 (centromere protein C1) is also known as Centromere CC kinetochore plate. The CENPC1 is a set on to anaphase. The method is cuseful for identifying a subject at risk of breast cancer, for early CC diagnosis, prevention and treatment of breast cancer, to analyze and cC predict a response to a breast cancer treatment, and in clinical drug trials. The present sequence was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a subject at risk of breast cancer by detecting the presence of polymorphic variations in the DLG1, KIAAO783, DPF3 or CENPC1 regions which are associated with breast cancer in a nucleic acid sample from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2004-441037/41.

                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method of treating bone morphogenic protein (BMP)-related disorder or condition. The method involves administering a BMP antagonist to a subject suffering from a BMP-related disorder, blocking biological activity of a BMP or inhibiting the progress of a BMP-related disorder or condition. The BMP-related disorder or condition is a heterotopic cranial symostosis (HO), fibrodysplasia ossificans progressiva (FOP), or sclerostosis. The present sequence is mouse noggin DNA specific PCR primer. This sequence is used in the exemplification of the invention.

```

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to gener fragments, ligating adaptor segments to their ends, amplifying them uprimer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR) and an adaptor segment. The present sequence is an example of a compound SSR primer. method represents a modified amplified fragment length polymorphism

esp. in acid to generate

them using

SSR primer.

an adaptor

Example 2; Page 84; 173pp; English. Modified amplified fragment length popolymorphism esp. in micro:satellite WPI; 1996-277795/28.

The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection; polymorphism; perfect compound simple sequence repeat; adaptor directed primer; genome; genetic; fingerprinting; amplified fragment length polymorphism assay; microsatellite region; genetic trait marking; germplasm comparisons; compound; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence

                                                                                                                                                       CC Oligonuclectides AAX52276-532 represent PCR primers and probes used to CC isolate and amplify cDNA encoding secreted and transmembrane human CC proteins (see AAX52213-74 and AAY13344-403). The cDNA sequences are CC obtained from cDNA libraries, prepared from fetal lung, fetal kidney, fetal brain, fetal liver and fetal retina. The encoded polypeptides have CC specific uses based on their homology to known polypeptides, e.g. PRO211 and PRO217 can be used for disorders associated with the preservation and CC maintenance of gastrointestinal uncosa and the repair of acute and CC chronic mucosal lesions (e.g. enterocolitis, Zollinger-Ellison syndrome, CC gastrointestinal unceration and congenital microvillus atrophy), skin CC diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial cancers such as lung squamous cell carcinoma of the CC vulva and gliomas), potent effects on cell growth and development, CC diseases related to growth or survival of nerve cells including CC parkinson's disease, Alzheimer's disease, ALS, neuropathies or cancer. CC PRO265 can be used as for fibromodulin, e.g. for reducing dermal CC scarring, PRO264 can be used as a target for anti-tumor drugs. PRO533 may be used in the treatment of Usher Syndrome or Atrophia areata; PRO269 can be used for treating problems of the kidney, uterus, endometrium, CC can be used for treating problems of the kidney, uterus, endometrium, CC blood vessels, or related tissue, e.g. in the heart of genital tract crow blood vessels, or related tissue, e.g. in the heart of genital tract

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an isolated polynucleotide encoding a stromal cell derived factor-1 (SDP-1) variant (I) designated SDP1-3'A. SDP-1 variant (I) is useful for determining the prognosis of a subject exposed to HIV-1; and determining the susceptibility of a subject to HIV infection. It is useful for prevention of HIV infection, and for treatment of a subject at risk of or having an HIV infection or disorder, and for treatment of disorders associated with expression of CXCR4. It is useful for patients suffering from AIDS or ARC. The present sequence represents a PCR primer for SDP1-3'A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFE7A, or a humanised version of HFE7A containing identical CDRs (complementarity determining regions) to antibody HFE7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allargy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AlDS and organ graft rejection. The present sequence represents a humanised HFE7A-derived anti-Fas antibody heavy chain sequencing primer used in an exemplification of the invention. (Updated on 15-SEP-2003 to standardise OS field)

The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFS7A, or a humanised version of HFS7A containing identical CDRs (complementarity determining regions) to antibody HFS7A. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. The present sequence represents a humanised HFS7A-derived anti-Fas antibody heavy chain sequencing primer used in an exemplification of the invention. (Updated on 15-SEP-2003 to standardise OS field)
The invention provides a DNA molecule comprising a sequence of nucleotides encoding an alphalf-subunit of a mammalian retinal calc: channel (RCC), including a human alphalf-subunit, a murine alphalf-subunit and orthologs of the human and murine alphalf-subunits. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Retinal calcium channel; RCC gene; alphalf-subunit; retinal disorder; myopia; nystagmus; strabismus; calcium-regulated development pathway; eye disorder; human; CACNAIF; CSNB; mutational analysis; PCR primer;
                                                                                                                                                                                                       New isolated mammalian retinal calcium channel gene, used to develop products for the diagnosis and treatment of incomplete congenital stationary night blindness and related disorders.
                                                                                                                                                      Disclosure;

The RCC gene can provide information as to the basic defect in this retinal conditions, which could lead to effective methods for treatment or cure of the disorder. As the associated features of myopia, nystagmus and strabismus frequently observed in patients with incomplete CSMB may be caused by calcium-regulated development pathways, identification of the RCC gene may help to elucidate the molecular details of eye development and which may lead to treatment for related eye disorders or diseases. Sequences AAZ46563-650 represent human CACNAIF (alphalf-subunit of RCC gene) exon-specific

New humanized anti-Fas antibody, useful for treating or preventing inflammatory or autoimmune disease, induces apoptosis selectively i inflammatory or autoimmune disease, sells with abnormal Fas-Fas ligand systems.

Example reference 15; Page 139; 263pp; English

This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between

CC antisheumatic, nephrotropic, antiinfertility, neuroprotective,
CC antistreviosclerotic, cardiant and hepatropic activity. (1) induce
CC apoptosis by binding to cell surface Fas or inhibit it by competitive
CC inhibition of ligand binding. (1) are used to treat and/or prevent
CC diseases associated with the Fas/Fas ligand system, especially systemic
CC versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
CC versus host disease, Sjorgen's syndrome, pernicious or hypoplastic
CC disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
CC disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
CC disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
CC dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis,
CC cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
CC (B, C or D) or alcoholic), and transplant rejection. (1) selectively
CC inhibit apoptosis in normal cells but selectively induce it in abnormal
CC cells. They bind to both human and murine Fas, so can be evaluated in
CC murine disease models. (1) act on the active site of Fas, i.e. they minic
CC inducing a human anti-murine antibody response. This sequence represents
CC primer used in the construction of a humanised anti-Fas antibody HFE7A
CC designed heavy chain which is used in the method described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New humanized anti-Pas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Pas ligand systems.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example reference 15; Page 139; 263pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is that of a forward PCR primer that was used in the identification of cDNA clone DNA30487-1231 (see AAA49722), which encodes human antitumour protein PRO328 (see AAY95343). cDNA from a human foetal kidney library was used as template for PCR amplification. A claimed method for inhibiting the growth of a tumour cell comprises exposing the tumor cell to PRO179, PRO207, PRO320, PRO219, PRO221, PRO224, PRO328, PRO301, PRO526, PRO326, PRO356, PRO509 or PRO866 (see AAY95317-49). The tumour is especially breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder or central nervous system cancer, melanoma or leukaemia. Nucleic acids encoding PRO179 etc. are used in the recombinant
